The $s(n)$ function

Preimages of
the sum of
proper divisor
function

Lola
Thompson

Introduction

Image of s

Preimage of
 s

Integers with
missing digits

Definition

Let $s(n)$ denote the sum of proper divisors of n .

Example: $s(p) = 1$ for any prime p

Example: $s(12) = 1 + 2 + 3 + 4 + 6 = 16$

We can write $s(n) = \sigma(n) - n$, where $\sigma(n)$ is the sum-of-divisors function.

Perfect numbers

function

Lola
Thompson

Introduction

Image of s

Preimage of
 s

Integers with
missing digits

We can view s as a dynamical system, looking at its iterates:

$$6 \rightarrow 6$$

$$8 \rightarrow 7 \rightarrow 1$$

$$10 \rightarrow 8 \rightarrow 7 \rightarrow 1$$

$$12 \rightarrow 16 \rightarrow 15 \rightarrow 9 \rightarrow 4 \rightarrow 3 \rightarrow 1$$

$$28 \rightarrow 28$$

$$220 \rightarrow 284 \rightarrow 220$$

$$276 \rightarrow 396 \rightarrow \dots$$

A sequence of these iterates of s is known as an *aliquot sequence*.

Conjectures on the iterates of s

Preimages of
the sum of
proper divisor
function

Lola
Thompson

Introduction

Image of s

Preimage of
 s

Integers with
missing digits

Catalan-Dickson Conjecture: Every aliquot sequence is bounded.

Guy-Selfridge Counter-Conjecture: Most aliquot sequences starting from an even number are unbounded.

No unbounded aliquot sequences are known, but the first candidate is 276.

Computational evidence

Preimages of
the sum of
proper divisor
function

Lola
Thompson

Introduction

Image of s

Preimage of
 s

Integers with
missing digits

Evidence against Catalan-Dickson? Bosma looked at aliquot sequences with starting numbers below 10^6 . Approximately $1/3$ of the even starters have yielded aliquot sequences that haven't yet terminated (computed up to 10^{99}).

Evidence against Guy-Selfridge? Bosma and Kane found that the asymptotic geometric mean of the ratios of $s(2n)/2n$ is slightly below 1.

“Studying the comparison of $s(n)$ to n led to theorems of Schoenberg, Davenport, and Erdős-Wintner, and the birth of probabilistic number theory.” -Carl Pomerance

In this talk, we will focus on two particular questions concerning the function $s(n)$:

- 1 Which numbers are of the form $s(n)$?
- 2 How large is the set $s^{-1}(n)$?

And then we will involve the integers with missing digits...

The function s can map sets of asymptotic density 0 to sets with positive asymptotic density.

Example If $\mathcal{A} = \{pq : p, q \text{ prime}\}$ then \mathcal{A} has asymptotic density 0 but $s(\mathcal{A})$ has asymptotic density $1/2$.

Example Erdős constructed sets \mathcal{A} of positive density such that $s^{-1}(\mathcal{A})$ not only has density 0 but is, in fact, empty.

We can assume that $\epsilon \geq 1/\log \log x$.

Let \mathcal{A} be a set of at most $x^{1/2+\epsilon}$ integers.

When counting $m \leq x$ with $s(n) \in \mathcal{A}$, we can immediately discard inconvenient n , including:

- $n \leq x^{1/2}$
- n with no prime factor up to $\log x$
- n with squarefull part $> x^{2\epsilon}$
- n with $\gcd(n, \sigma(n)) > \log x$
- n with a divisor between $x^{1/2-10\epsilon}$ and $x^{1/2+10\epsilon}$

(With each of these conditions, we throw out $o(x)$ integers.)

Proof Strategy:

- 1 Show that for each $a \in \mathcal{A}$, the number of remaining $n \leq x$ with $s(n) = a$ is $\leq x^{1/2-\epsilon}$.
- 2 Since $\#\mathcal{A} \leq x^{1/2+\epsilon}$, this “pointwise” bound on the number of preimages is enough to complete the proof that

$$\#\{n \leq x : s(n) \in \mathcal{A}\} = o(x).$$

Where are we at?

Given d , we want to count the number of possibilities for $s(e)$. We know that $s(e)$ is in a uniquely determine residue class mod $s(d)/\gcd(s(d), \sigma(d))$.

We want an upper bound on $s(e)$. A lower bound is easy:
 $s(e) \geq e/P^-(e)$.

The lower bound isn't so helpful, but it's not difficult to show that it isn't too far from the truth:

$$s(e) \ll \log x \cdot \frac{e}{P^-(e)}.$$

Proof Sketch

Preimages of
the sum of
proper divisor
function

Lola
Thompson

Introduction

Image of s

Preimage of
 s

Our result

Integers with
missing digits

Recall:

$$s(e) \ll \log x \cdot \frac{e}{P^-(e)}.$$

Since $de = n \leq x$, we have $e \leq x/d$, so

$$s(e) \ll \log x \cdot \frac{x}{dP^-(e)}.$$

Remember $dP^-(e) \geq x^{1/2+10\epsilon}$, so

$$s(e) \ll \log x \cdot x^{1/2-10\epsilon}.$$

 s

Integers with
missing digits

Our results

Maynard asked: Are there infinitely many primes with a given digit (e.g., 7) missing? Observe that:

$$\sum_{p \text{ prime}} \frac{1}{p} = \infty$$

$$\sum_{p \text{ no } 7\text{'s}} \frac{1}{p} \leq 100$$

Conclusion: The set of primes without any 7's in their decimal representations is very "thin" compared with the full set of prime numbers.

Extra challenge: applying sieve methods to "thin" sets.

Theorem (Maynard, 2022)

There are infinitely many n such that $P(n) \in \mathcal{W}_{\mathcal{D}}$, for any given non-constant polynomial $P \in \mathbb{Z}[X]$, large enough base g , and $\mathcal{D} = \{0, \dots, g-1\} \setminus \{a_0\}$.

Theorem (Benli, Cesana, Dartyge, Dombrowsky, T., 2024)

*Let \mathcal{A} be a set of integers with missing digits in any base $g \geq 3$.
Then $s^{-1}(\mathcal{A})$ has asymptotic density 0.*

In other words, the EGPS Conjecture holds for sets of integers with missing digits!

Theorem (Benli, Cesana, Dartyge, Dombrowsky, T., 2024)

Fix $g \geq 3$, $\gamma \in (0, 1)$, and a nonempty subset $\mathcal{D} \subsetneq \{0, \dots, g-1\}$. For all x sufficiently large, the number of $n \leq x$ for which $s(n)$ has all of its digits in base g restricted to digits in \mathcal{D} is $O\left(\frac{x}{e^{(\log \log x)^\gamma}}\right)$.

How sharp is our bound?

Introduction

Image of s

Preimage of
 s

Integers with
missing digits

Our results

Recall that $s(p) = 1$ for all primes p .

Then, if \mathcal{D} contains 1, it follows that

$$\#\mathcal{W}_{s,\mathcal{D}}(x) \geq \pi(x) \sim \frac{x}{\log x}$$

as $x \rightarrow \infty$.

Thus, our result is optimal* for arbitrary g, \mathcal{D} .

*In the sense that γ cannot be replaced by a constant strictly greater than 1.

Sums of proper divisors with many missing digits

Integers with
missing digits

Our results

Recall:

Theorem (Pollack, Pomerance, T., 2017)

Let $\epsilon \rightarrow 0$ as $x \rightarrow \infty$. Suppose \mathcal{A} is a set of at most $x^{1/2+\epsilon}$ positive integers. Then, as $x \rightarrow \infty$,

$$\#\{n \leq x : s(n) \in \mathcal{A}\} = o_\epsilon(x)$$

uniformly in \mathcal{A} .

Recall:

Theorem (Pollack, Pomerance, T., 2017)

Let $\epsilon \rightarrow 0$ as $x \rightarrow \infty$. Suppose \mathcal{A} is a set of at most $x^{1/2+\epsilon}$ positive integers. Then, as $x \rightarrow \infty$,

$$\#\{n \leq x : s(n) \in \mathcal{A}\} = o_\epsilon(x)$$

uniformly in \mathcal{A} .

If we remove at least half of the possible digits, then the size of this set of integers with missing digits is $O(\sqrt{x})$. Our 2017 result implies that the EGPS conjecture holds for this set.

Theorem (Benli, Cesana, Dartyge, Dombrowsky, T., 2024)

The function $s(n)$ takes infinitely many values in $\mathcal{W}_{\mathcal{D}}$.

Proof.

Recall that if p, q are distinct primes then $s(pq) = p+q+1$.
Earlier in this talk, we used this family of integers to show that
almost all odd numbers are contained in the image of s .

Theorem (Benli, Cesana, Dartyge, Dombrowsky, T., 2024)

The function $s(n)$ takes infinitely many values in $\mathcal{W}_{\mathcal{D}}$.

Proof.

Recall that if p, q are distinct primes then $s(pq) = p+q+1$.

Earlier in this talk, we used this family of integers to show that almost all odd numbers are contained in the image of s .

Thus, it is sufficient to show that a positive proportion of integers with missing digits can be expressed as a sum of 1 plus a sum of two primes.

Integers with
missing digits

Our results

In summary:

- Surprisingly little is known about $s(n)$ after millennia of study!
- EGPS conjectured that $s^{-1}(\mathcal{A})$ has asymptotic density 0 when \mathcal{A} has asymptotic density 0.
- This has been confirmed for sets with specific structures (e.g., sets of integers with missing digits) and for sets of certain sizes ($O(x^{1/2+\varepsilon})$).
- The EGPS conjecture is still open.
